

COHERENT FREQUENCIES AND HOMOEOPATHY

Cyril W. Smith, Ph.D.

Honorary Senior Lecturer (retired), School of Acoustics and Electronics,
University of Salford, Salford M5 4WT, UK

OBJECTIVE To present the art of homoeopathy through the physics of coherent frequencies, in water and on the acupuncture meridians.

METHODS The diagnosis and therapy of electromagnetically hypersensitive patients showed that water in a sealed glass ampoule became clinically effective after succussion in an alternating magnetic field at some patient specific coherent frequency and with no chemical information transfer possible, thereby putting any theory of homoeopathy firmly within the physical properties of water. Frequency measurements of water imprinted at the acupuncture points showed that unique endogenous frequencies were present on each meridian. These persist to the target organ tissues.

RESULTS Frequency entrainment at acupuncture points and *in vitro* was found to result from exposure either to exogenous technical frequencies, chemicals, the frequency signatures of chemicals with trace water or, homoeopathic potencies. The frequencies characterising a homoeopathic potency entrain nearby endogenous frequencies of acupuncture meridians to those of the potency. The therapeutic effect of homoeopathy is seen through the similia principle as re-programming the frequency activity of specific target organs by forcing adaptation to a 'healthy' frequency. The characteristics of a homoeopathic potency are altered on heating and permanently erased by briefly shielding from the geomagnetic field in a closed steel box. It has been shown that an imprinted frequency pattern is retained in daughter cells cultured *in vitro* thereby demonstrating that permanent re-programming of cells, and by implication tissues and organisms, is possible by homoeopathic therapy.

CONCLUSIONS

The basis of the art of using homoeopathic potencies lies explicitly in the frequency patterns of the homoeopathic potencies in the frequency memory of coherent water, and is implicitly known from 'provings'. The art is in matching these to the needs of the patient. On the Del Giudice - Preparata theory for coherence in water, there can be many interacting frequencies, each with a proportional velocity of propagation. The far-infrared (FIR) rotational spectra of water-laser lines correlate with various measured frequencies for homoeopathic potencies and frequencies on acupuncture meridians. Using a single frequency imprinted in water to simulate a homoeopathic potency, the potentising process seems to split spectral lines in the FIR in proportion to the frequency being potentised with coupling through coherence to other parts of the spectrum but, with certain selection rules for dilution ratios. Water memory relies on the geomagnetic field for its retention. The use of coherent frequencies by living systems and the entrainment of homoeopathic potency frequency signatures at acupuncture meridians is the formal link between homoeopathy and acupuncture.
