

An “Alternative Medicine” View of Mobile Phones

Cyril Smith presents his unorthodox views on their health problems

In 1975, I published a letter with Professor Herbert Fröhlich suggesting that anomalous magnetic effects in enzymes could be due to superconducting regions. Since then, the evidence that quantum physics is necessary to describe living systems and water has steadily accumulated. In 1982, I was asked if I could help with the diagnosis and treatment of electrically sensitive patients? This work continues¹. I have seen a few persons completely incompatible with modern technology but many more who are disabled to a greater or lesser extent by their electromagnetic environment, usually these persons are also very chemically sensitive.

The test I use for these patients and which I propose to any biologists prepared to listen, is to see if the living system is affected by the field near a toroidal coil. This contains the **B** magnetic field component within the torus but, it is surrounded by the vector potential component **A**. This quantity comes into the Hamiltonian from which the wave function describing the motion of a charged particle in an electromagnetic field is derived. One biologist who tried this experiment wrote, “...The results with the toroidal coil are quite tantalizing...”.

One of my retirement activities has been to investigate dowsing as a scientific instrument. I had noticed that many devices aimed at reducing electromagnetic stress used the frequency 7.8 Hz. Investigation showed that this frequency occurs naturally (endogenous) on the heart chakra as used in Indian medicine and on the heart meridian as used in classical Chinese acupuncture.

Following this lead, I have been able to map out all the frequencies endogenous to the chakras and the acupuncture meridians¹ - both Chinese classical meridians and electroacupuncture meridians as used by Dr. Voll. These frequencies extend from 10^{-4} Hz to 10^{+11} Hz. Only in the kilohertz region can they be measured with objective instrumentation².

Frequency then appears as a formal link between acupuncture and homoeopathy. Exogenous (environmental) frequencies can entrain or synchronise nearby endogenous frequencies, the result may be either stressful or therapeutic. Near to a mobile, entrainment of its frequencies usually only persists while the phone is switched-on, and soon relaxes after it is turned-off.

However, these frequencies can be imprinted into water by the classical methods of homoeopathic ‘potentisation’. They also can be imprinted by other methods^{1,3}, one of which requires a train of at least 7-unidirectional voltage pulses. These are adequately provided when the dialing code goes out from a mobile phone and will potentise or imprint its frequencies into any water or body tissue within 3 cm of the case. Such an imprint in my hand took about ½ hour to decay, I shall not try to imprint my head! The Table below lists the frequencies imprinted from this mobile, their likely function in the mobile and the meridians/chakras stressed.
