

An Alternative Medicine Approach to RF Interactions with Humans.

Cyril W. Smith

Since 1982, the writer has been involved with the diagnosis and therapy of electromagnetic hypersensitivity in humans involving RF and other frequencies. This work, subsequently double-blinded by Rea et al., found that effects occurred predominantly in patients with ongoing multiple chemical sensitivities. Frequency and its coherence are the most relevant parameters. The clinical effects of a specific frequency and a specific toxic chemical are interchangeable.

This work led to the investigation of coherence phenomena in water, homoeopathy and acupuncture. One important consequence of coherence is the multiple frequency phenomenon. For a coherent system bounded by its coherence length this becomes the constant parameter making frequency proportional to the coherence velocity. There can be many velocities and corresponding frequencies. Bio-interactions in the RF are reproduced in response to ELF, microwave, far-infrared or optical frequency stimulation. Living systems may react to the frequency of a magnetic vector potential from an alternating current in a toroidal coil implying these are quantum effects. Power levels are largely irrelevant. Effects may be produced in response to passive resonant circuits, whether building structures or chemicals, by thermally stimulated coherence.

Objective physical measurements are difficult although not impossible. The responses of human reactions are clinically more useful; the writer has developed the techniques of dowsing and Omura and co-workers have developed a digital muscle strength test (BIDORT).

The RF interactions involved in acupuncture occur as frequency synchronisation or entrainment between some external oscillation and the characteristic endogenous frequency of a specific meridian. The process of potentiating a homoeopathic preparation involves line splitting in the FIR rotational water spectrum, this spreads to lower frequencies by the multiple frequency coherence effect. That potency/frequency pattern which is therapeutic in the sick will reproduce those symptoms in the healthy; chronic exposure to either will render symptom indistinguishable from disease.
